FUEL TANK'S AND ACCESSORIES

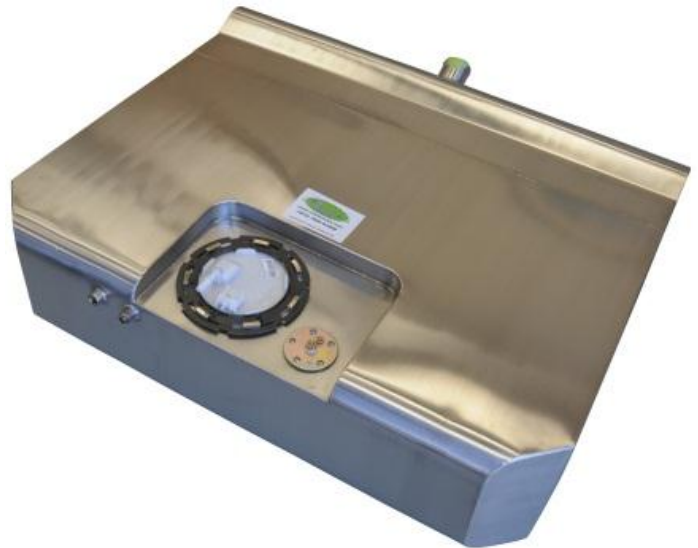

## Rick's Tanks Vaporworks Technology

Rick's Tanks now offers their Vaporworks technology as an option in most of the stainless steel gas tanks.

The Vaporworks technology is based around a late model GM fuel pump module spec'd from a Camaro ZL1 or CTSV. Rick's then incorporated two special pickups placed in each side of the tank. These pickups are 'live' as they open and close in relation to fuel presence to ensure positive fuel volume and pressure under extreme acceleration and cornering.

Currently, Vaporworks technology is available in first through their generation GM F-bodies, first through second A and G-bodies, '65-70 Mustangs and most Mopar applications.

Rick's tanks are handcrafted in El Paso, Texas, resulting in outstanding quality of construction and perfect fit. Tanks are available for most popular '50-70's hot rods and muscle cars, and they can build or match most other tanks or designs. The experienced team can build a tank to suit your needs with internal high volume pumps, chambering and custom applications.
